eENVplus

eENVplus Infrastructure

Umberto Di Staso, Piergiorgio Cipriano
Fondazione Graphitech, Sinergis

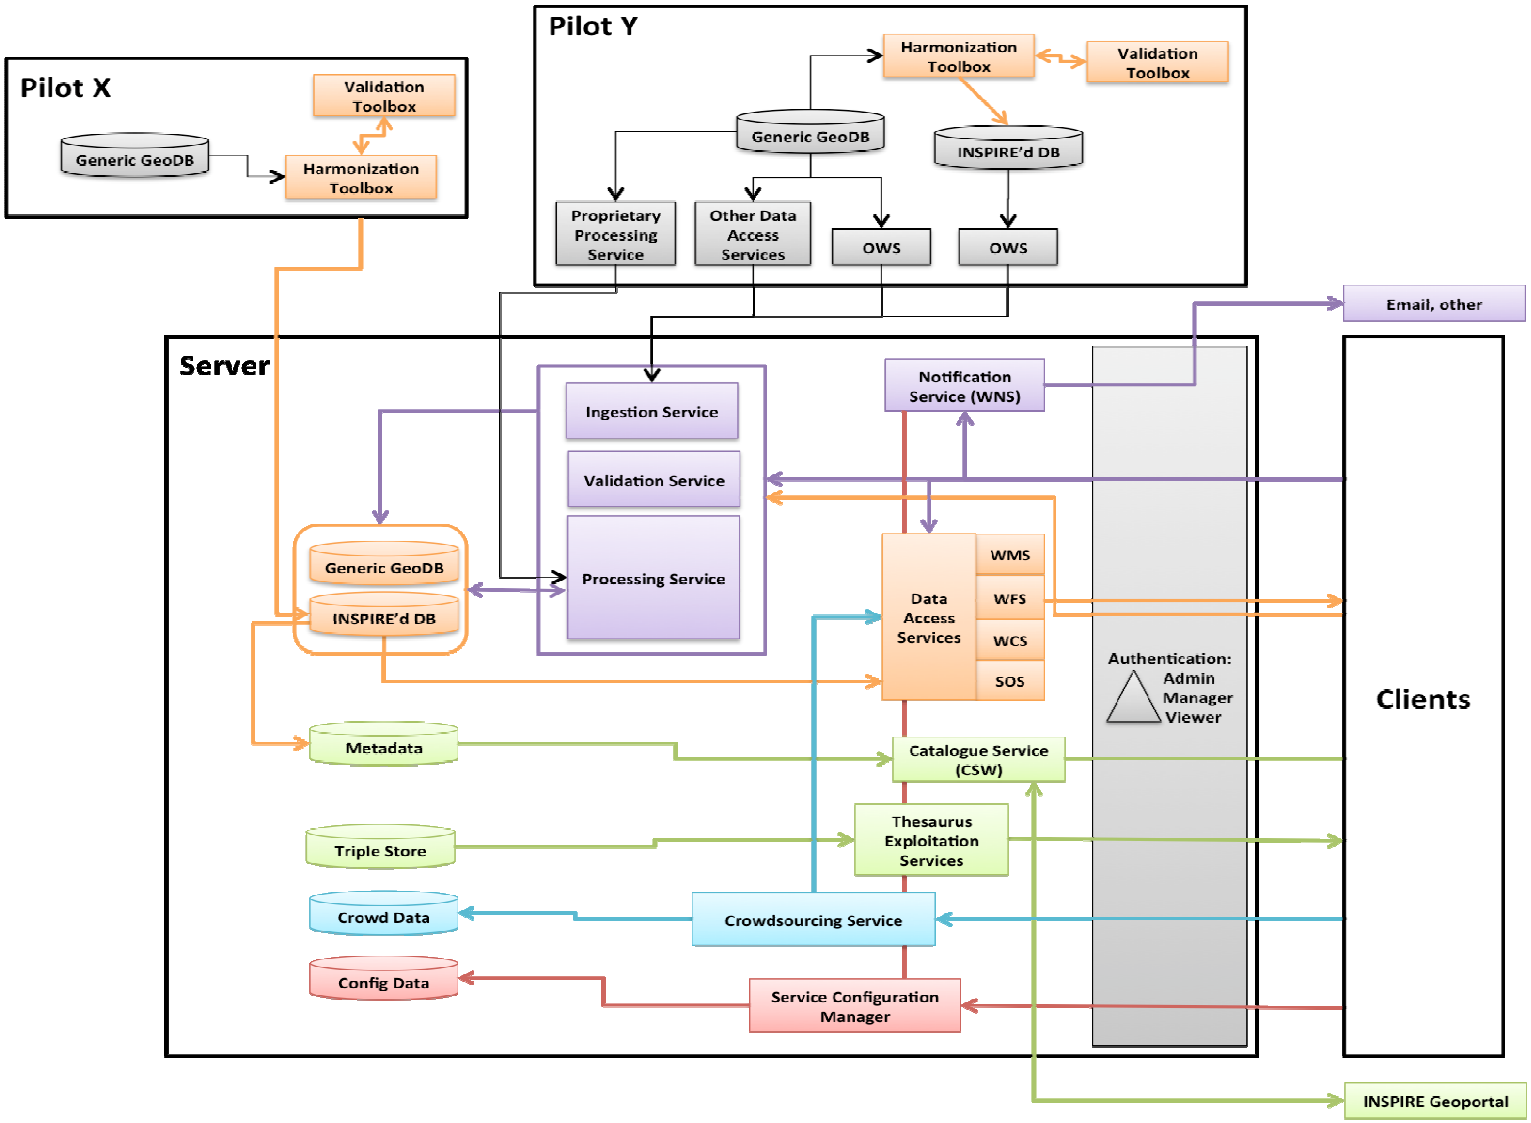
A clustering approach to eENVironmental Services for advanced applications and capacity building within INSPIRE and SEIS

eENVplus Infrastructure

The eENVplus infrastructure includes:

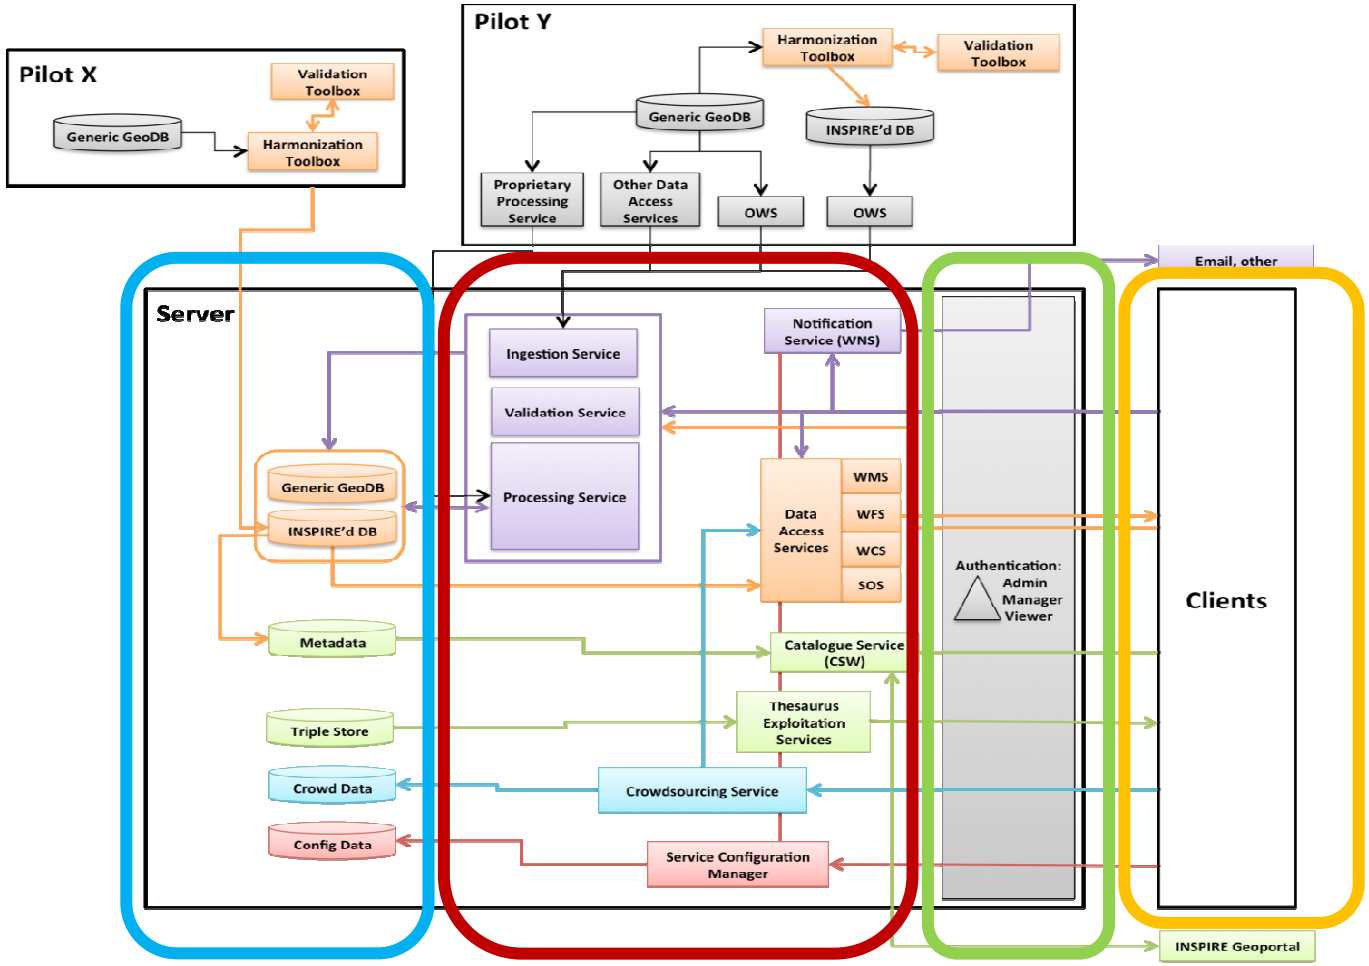
- A set of web services for data access, data ingestion and data exposal.
- A set of server-side features to manage advanced geo-processing services.
- A set of clients used to test the offered services.

Proposed Architecture



eENVplus Infrastructure

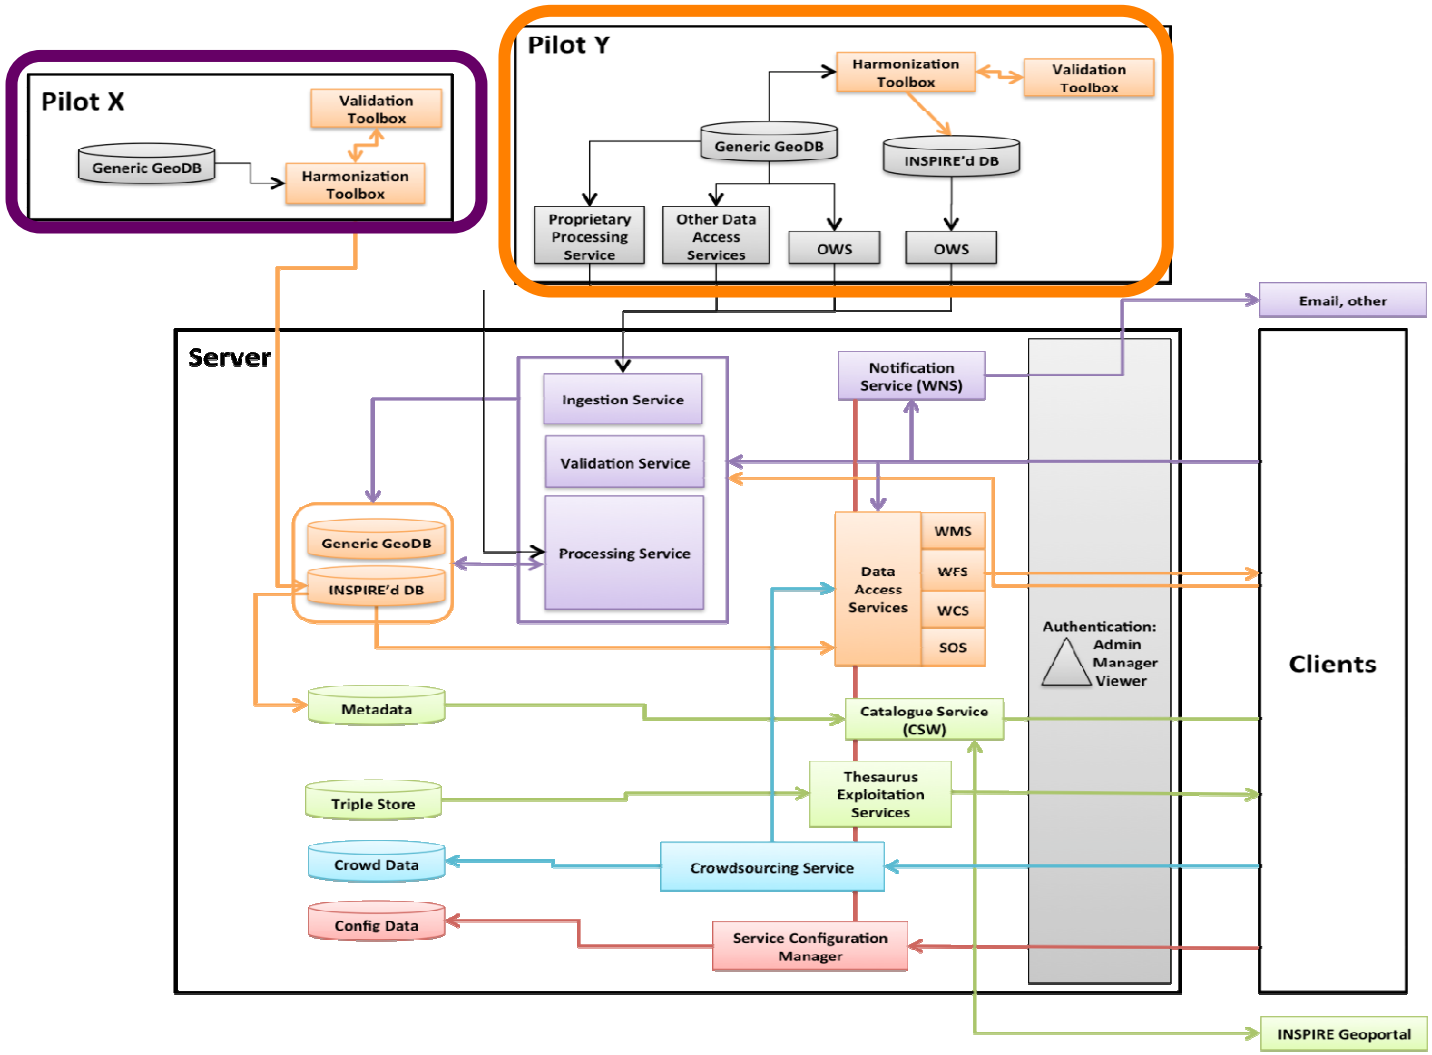
Data Layer | Middlewar Layer | Security Layer | Application Layer



Architecture Layers

- Data Layer: set of databases that have to be set up to store provided data
- Middleware Layer: core of the infrastructure, contains the set of components used to ingest and expose data
- Security Layer: intermediate layer that manages access to resources
- Application Layer: contains the eENVplus client applications

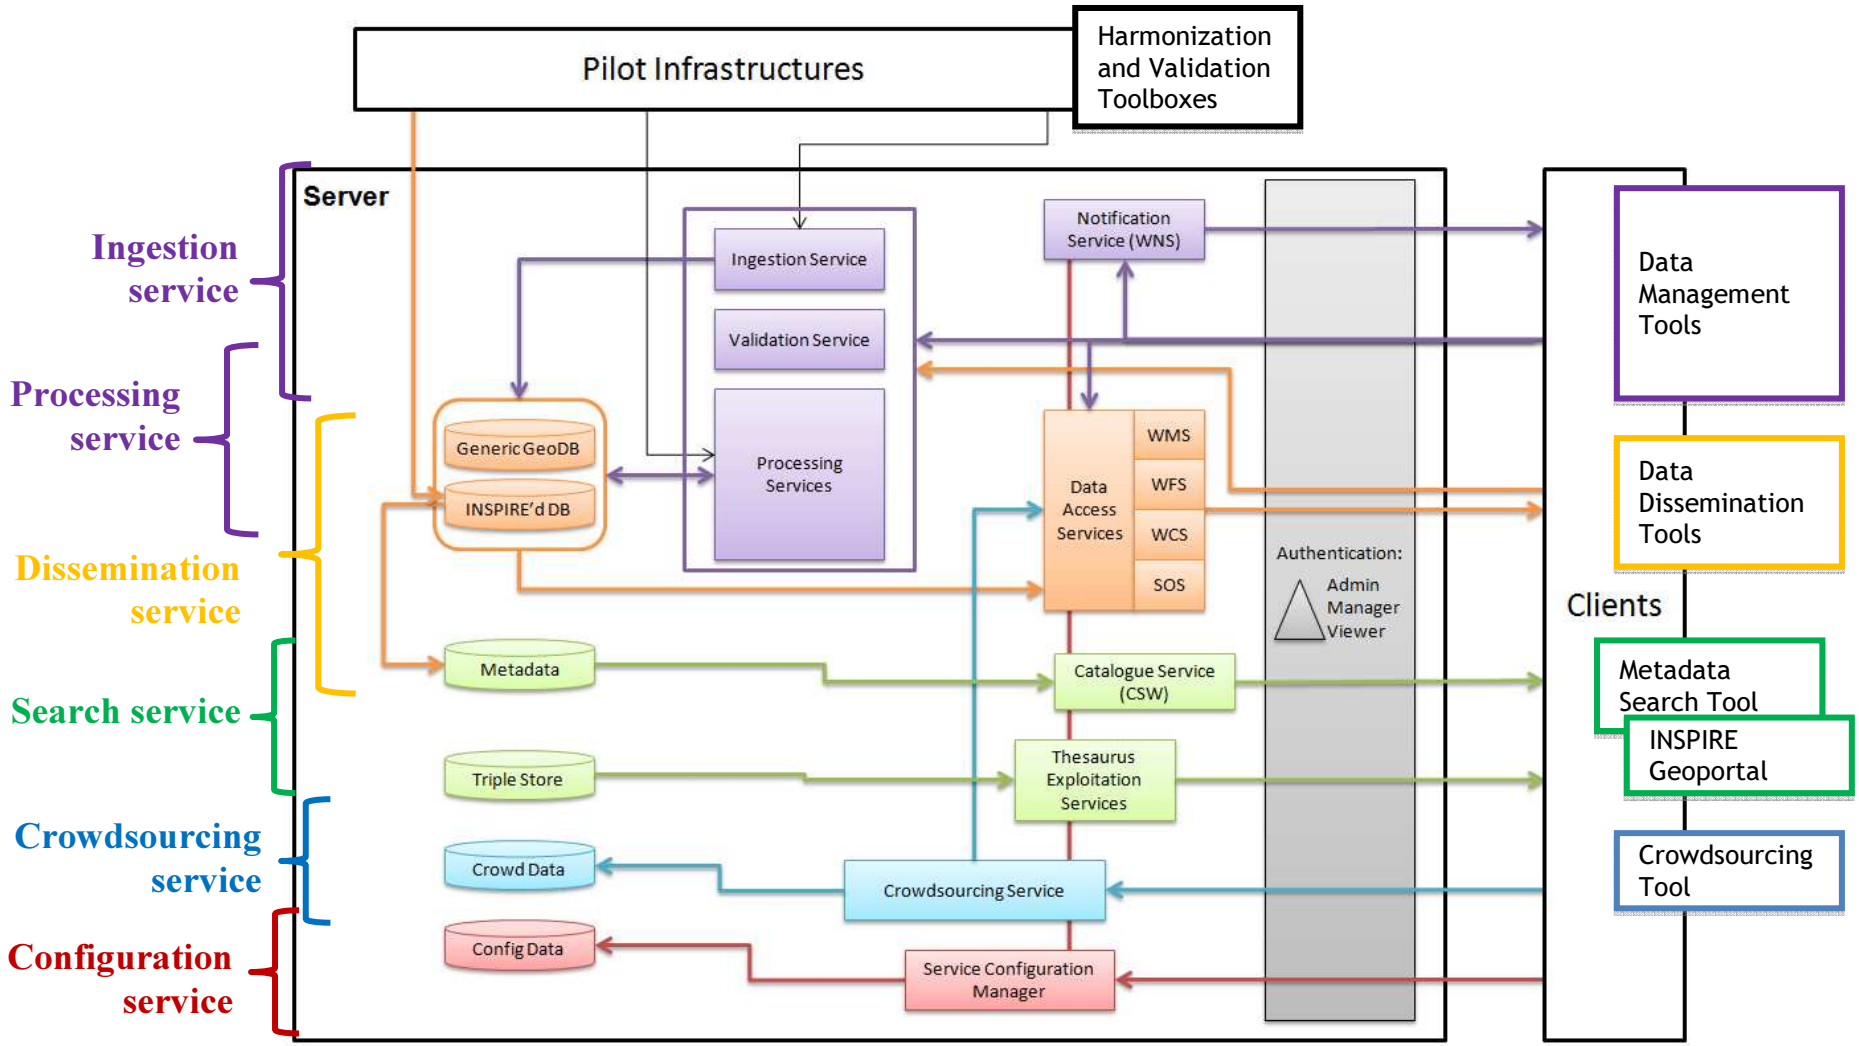
eENVplus Infrastructure



Architecture Layers

- Pilot X: pilot who haven't its own SDI and it is not able to expose data.
- Pilot Y: pilot who is able to expose data in some way (OWS – INSPIRE web services – proprietary web services).

Service Layers



Service Layers

- Ingestion Service: contains the set of software components used to manage the ingestion of data provided by pilots in the eENVplus infrastructure
- Processing Service: contains the set of web services used to fulfill the requirements about processing (WPSs)
- Dissemination Service: contains the software components that allows users to access data by the use of INSPIRE compliant web services

Service Layers

- Search Service: contains the software components used to perform semantic search in the metadata catalog
- Crowdsourcing Service: data and software structure that allows users to enrich the set of data available by giving theirs contribution
